What drives your design?

Stephan Hochdörfer, bitExpert AG

About me

- Stephan Hochdörfer, bitExpert AG
- Department Manager Research Labs
- enjoying PHP (and a little bit of Java) since 1999
- S.Hochdoerfer@bitExpert.de
- @shochdoerfer

Remark: Sorry no code!

Code is not important, the domain is!

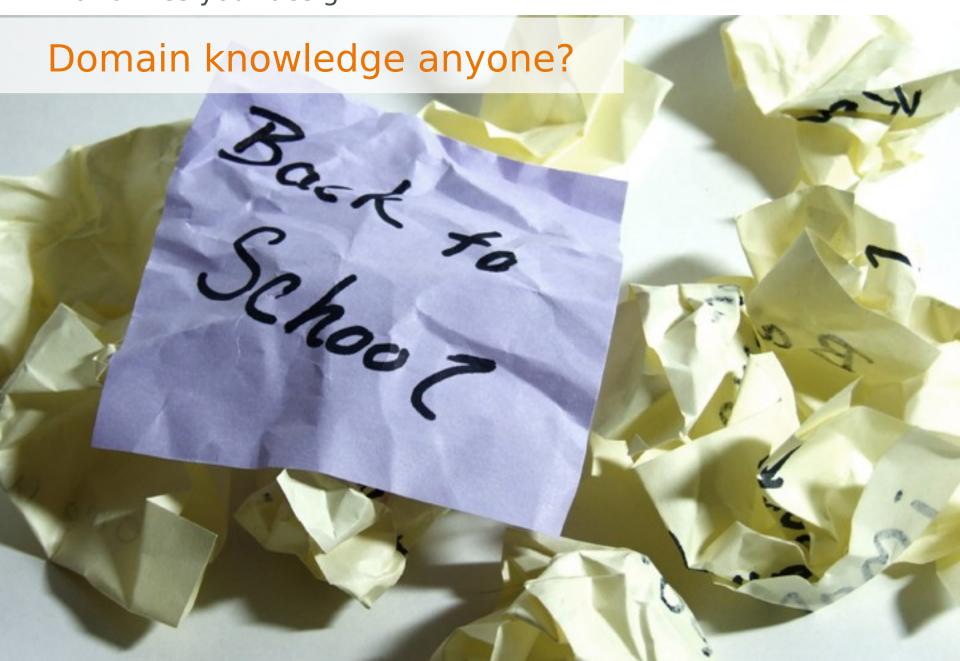

Domain Driven Design

What's a domain?

How to build domain knowledge?

How to express domain knowledge?

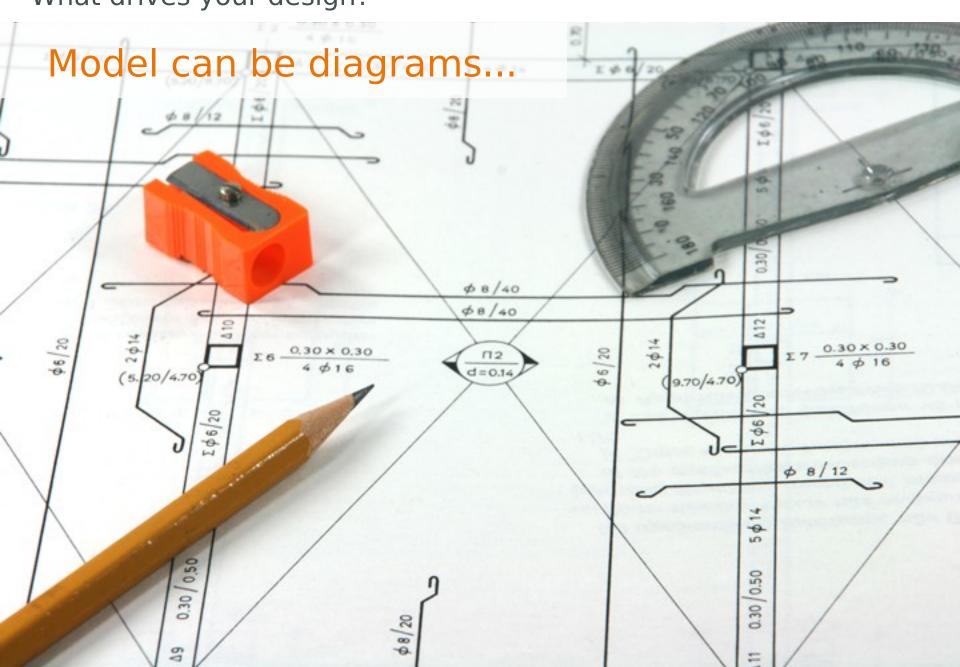

Models please!

Model can be written words...

Many models?

Analysis model

Code design

How to describe a model?

"Britain and America are two nations divided by a common language."

George Bernard Shaw / Oscar Wilde

"Business and Developers are two nations divided by a common language."

Casey Charlton

A language specific to a certain domain.

Please, use it in your code as well!

```
if(1 == node.getLeft()) {
    // handle root node seperatly

    // [...]
}
else {
    // handle all other nodes

    // [...]
}
```

```
if(node.isRoot()) {
    // [...]
}
else {
    // [...]
}
```

```
if(category.isStart()) {
    // [...]
}
else {
    // [...]
}
```

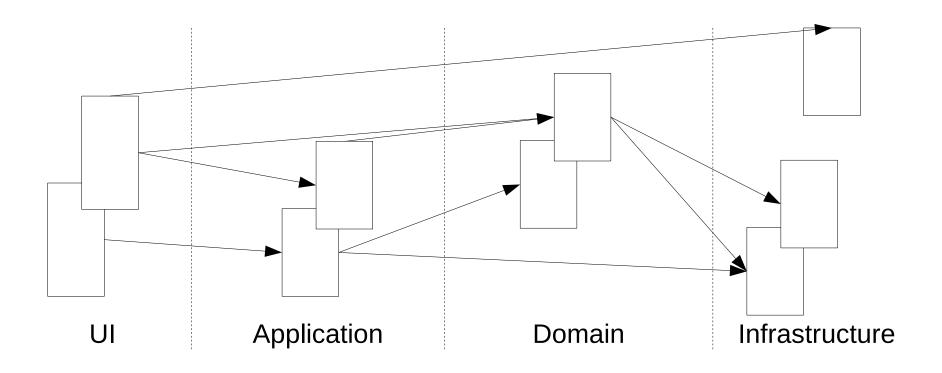

Bonus point: Discuss domain code with your client!

Layered architecture

Layered architecture

Layered architecture

Tightly coupled code will lead to unmaintainable code.

Entities

- Objects with an identity
- Spanning the life of the system
- The model must define what it means to the same thing
- e.g Person object

Value Objects

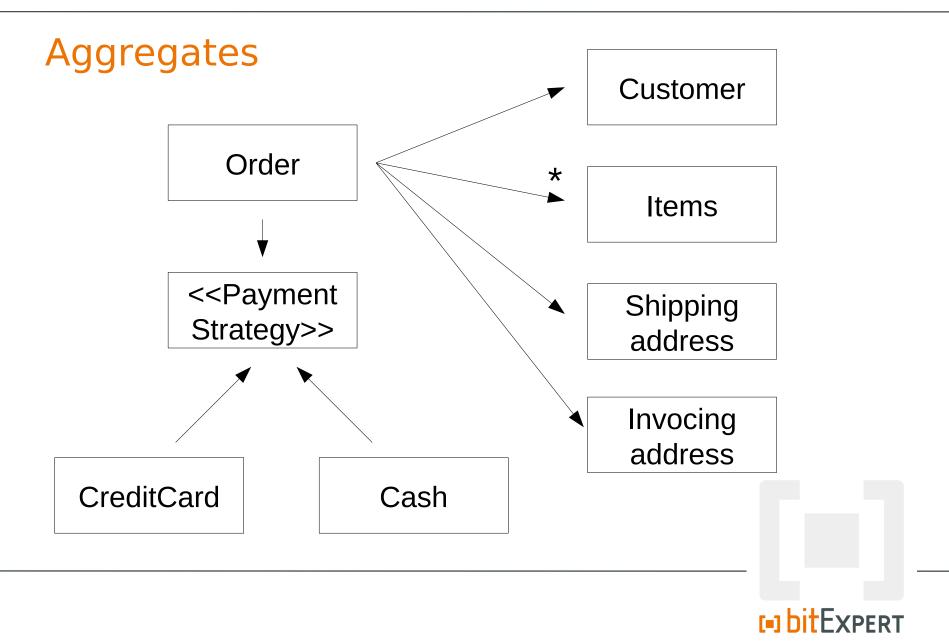

- Objects without an identity
- Can be easily created or discarded
- We do not care what the object is, but what it has
- References other Value Objects or Entities

Aggregates

Too many objects?

Service objects

- Services are verbs of the ubiquitious language.
- Provides functionality for the domain
- A service is not an store, does not provide persistency!
- Performs operations

Growing too big?

Growing too big?

Modularize!

Where to retrieve the data from?

Repositories

- No coupling to persitence infrastructure in domain code!
- Encapsulates the logic to retrieve object references
- Communicates with the infrastructure
- Does not care where the entries are stored
- One central place where the data communication happens

Repositories

Client

findCustomer("C7")

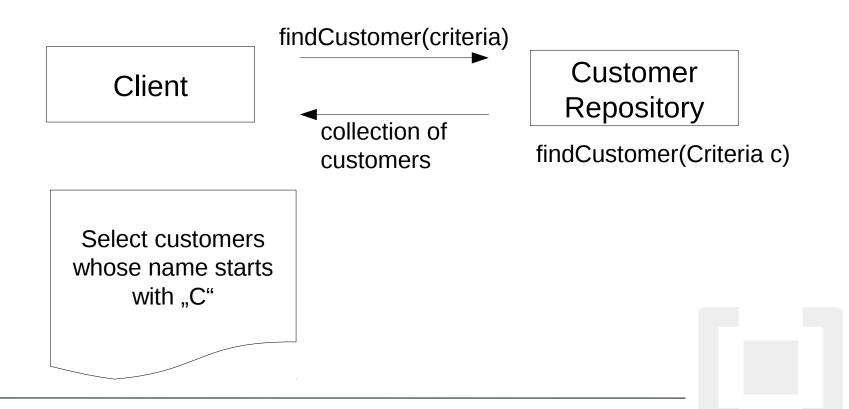

Customer

Repository

findCustomer(String id)

Repositories - Specifications

(bit Expert

Repositories - Specifications

```
var spec = newPizzaSpecification()
   .BasedOn(newMargaritaPizzaSpecification())
   .WithThickCrust()
   .WithExtraCheese();

var pizza = new PizzaFactory().
   CreatePizzaFrom(spec);
```

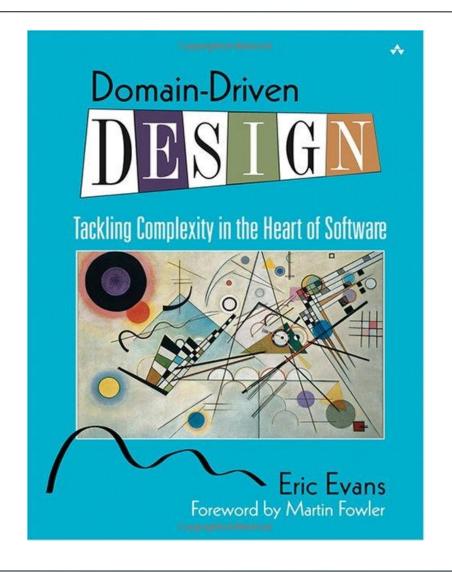

Repositories - Specifications for Queries

```
var margaritaPizzaCustomers =
newMargaritaPizzaSpecification();

var customers = this.customerRepository
    .GetCustomersSatisfying(margaritaPizzaCustomers);
```

(=) bitExpert

Thank you!
